

MUDJACKING

- Driveways, Garages, Sidewalks, Patios
- Concrete Leveling
- Saw Cutting
- Void Filling
- Foundation Repair and Waterproofing

Sunken, uneven or cracking areas along your concrete are caused by the washing away of the compacted fill under the concrete, or by the settling of the property. This leaves voids/spaces which cause unevenness to the weight of the concrete. Mudjacking is a fraction of the cost to replacing the concrete. This process involves drilling holes in to specific areas of the concrete and then pumping a flowable fill material into the holes to fill the air space. This will lift the concrete and/or fill the voids so that it is level with the adjoining concrete pieces, stabilizing the concrete. The drilled holes are then filled with non-shrink grout. This cost efficient method will prolong the life and use of your driveway, garage pad, patio and/or sidewalk.

LANDSCAPING/HARDSCAPING

Design Consulting

- Driveways
- Patios
- Retaining Walls
- Walkways and Stairs

Hardscape is defined as the inanimate, or non-plant elements, of landscaping, mainly masonry/stone work or woodwork. This would include stone walls/stairways, concrete or brick patios, tile paths, wooden decks and wooden arbors. It could also be defined as anything used in landscaping that is not part of the softscape can be considered a hardscape element, including water fountains and, yes, even garden ornaments.

IRRIGATION SYSTEMS

Our design consultants will provide you with a written estimate and a custom made design to suit your irrigation needs.

We also provide winterizing service to irrigation lines. This involves using an air compressor to empty the water lines to ensure that no water is left in the pipes to freeze over the winter months. **See our special offer details for 10% off the winterization of your irrigation system.**

UNIVERSAL DESIGN

Homes have their place, but your home has your heart.

- Obstacle Designing
- Ramps
- Bathroom/Kitchen
- Accessible Living Areas

Universal design is a relatively new phrase that emerged from barrier-free or accessible design and assistive technology. Universal design strives to be a broad-spectrum solution that produces buildings, products and environments that are usable and effective for everyone, not just people with disabilities. Moreover, it recognizes the importance of how things look which appeals to a wide range of consumers.

Examples of universal design include color-contrast dish ware with steep sides that assist those with visual problems. Cabinets with pull-out shelves, kitchen counters at several heights to accommodate different tasks and postures and low-floor buses that kneel and are equipped with ramps rather than lifts are additional examples.
